

Pocket Inventory

on Honeywell Dolphin Mobile Computers

SMARTER
BUSINESS
DECISIONS

→ Mobility, meet efficiency.

Retailers need up to date inventory information to ensure accurate stock levels and prevent theft of valuable merchandise. Most inventory operations, such as counting and receiving, happen away from the register. pcAmerica's **Pocket Inventory** solution on the **Honeywell Dolphin 6100** and **Dolphin 7600** introduces mobility and efficiency to your staff, enabling them to gather the information you need to make **smarter business decisions**.

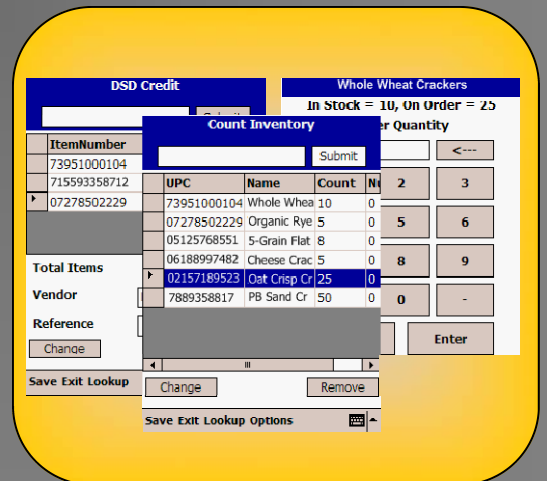

→ Count and track your inventory.

The "count" feature allows staff to scan each product and enter the number you have in stock. It's a faster and more accurate process than writing counts down and hand entering them at a later time. Counts are synchronized with the point of sale, and discrepancy reports can be generated to show where your stock levels are over or short.

→ Purchase Orders, Direct Store Deliveries.

Processing deliveries away from the storefront promotes an organized environment free of clutter. Purchase orders and direct store deliveries can be scanned in where they are received without bringing the items to the register. New orders can be created from the handheld by scanning shelf labels and entering the quantity to purchase. The information is synchronized back to your **Cash Register Express** point of sale system.
